

LinkedIn Integration Testing Guide

This guide outlines the steps to test the newly implemented LinkedIn "One-Click Publish" feature.

1. Prerequisites

Before testing, ensure your local environment is configured with the credentials you generated using the [AgroVentia LinkedIn Guide](#).

Update `.env.local`

Add the following keys to your `.env.local` file:

```
LINKEDIN_CLIENT_ID=your_client_id_from_guide
LINKEDIN_CLIENT_SECRET=your_client_secret_from_guide
NEXT_PUBLIC_BASE_URL=http://localhost:3000
TOKEN_ENCRYPTION_KEY=your_32_byte_encryption_key # Optional: If you changed the
default in wix-system-settings.ts
```

Note: Ensure `NEXT_PUBLIC_BASE_URL` matches your current testing environment (e.g., `http://localhost:3000`).

2. Testing Authentication (Connect Feature)

1. Navigate to the Admin Blog Dashboard:

- Open your browser and reload `http://localhost:3000/admin/blog`.
- Log in if prompted (MVP Password: `admin123`).

2. Initiate Connection:

- Click the **"Connect LinkedIn"** button in the top right corner.
- You should be redirected to LinkedIn's authorization page.

3. Authorize App:

- Sign in to LinkedIn (if not already logged in).
- Click **"Allow"** to grant permissions (AgroVentia Website Connect needs access to your profile/page).

4. Verify Success:

- After allowing, you should be redirected back to the Admin Dashboard.
- The URL should look like: `http://localhost:3000/admin/blog?success=true`.
- The button in the top right should now say **"Refresh Connection"** (though strictly in the MVP it might just redirect back; visual confirmation of "Connected" state relies on logic in `AdminBlogPage` which we can verify).

3. Testing "Share to LinkedIn"

1. Select a Post:

- Find a blog post in the list that has a status of "Pending" or "Not Shared".

2. Click Share:

- Click the **"Share to LinkedIn"** button next to the post.
- Confirm the browser popup dialog (**Share "Post Title" to LinkedIn?**).

3. Verify Success:

- **UI:** You should see an alert: **Shared successfully!**.
- **Status Update:** The post's status badge should change to **"Posted"** (Green).

4. Verify on LinkedIn:

- Go to your LinkedIn Profile (or the Company Page if you configured the app for the company).
- Check "Posts" or "Activity" to see if the new post appears with the correct Title and Link.

4. Troubleshooting

- **Error: "LinkedIn not connected":**
 - This means the tokens were not saved or decrypted correctly. Try clicking "Connect LinkedIn" again.
- **Error: "Failed to post to LinkedIn":**
 - Check your server console logs for **LinkedIn Share API Error**.
 - Common causes: Expired token, permissions revoked, or invalid URN.
- **Redirect Loop / 400 Error:**
 - Ensure your **redirect_uri** in the LinkedIn Developer Portal exactly matches what is in your **.env** (usually **http://localhost:3000/api/auth/linkedin/callback**).

5. Next Steps

Once verified locally:

1. Deploy the changes to Vercel/Production.
2. **Important:** Update the LinkedIn Developer App "Redirect URLs" to include your production domain (e.g., **https://www.agroventia.ca/api/auth/linkedin/callback**).
3. Add the production **LINKEDIN_CLIENT_ID** and **LINKEDIN_CLIENT_SECRET** to your Vercel Environment Variables.
